

Electricity Environmental Disclosure

The following environmental information is for electricity supplied by

Calpine Energy Solutions, LLC

January 1, 2020 through December 31, 2020

Power plants can generate electricity from a number of different fuel sources, resulting in different emissions. Calpine Energy Solutions, LLC will report fuel sources and emissions data to customers twice annually, allowing customers to compare data among the companies providing electricity service in Maryland. The standardized environmental data below are *regional averages only* of most power plants in the Mid-Atlantic region.

Energy Source Fuel Mix

The values shown represent 2020 averages for the PJM region.

Coal	16.54 %
Gas	35.07 %
Nuclear	25.08 %
Oil	0.00 %
Other	0.60 %
Renewable Energy	
Landfill Gas	1.93 %
Biogas	2.57 %
Hydroelectric	2.48 %
Solar	2.35 %
Municipal Solid Waste	3.61 %
Wind	7.27 %
Wood or other Biomass	2.35 %

Renewable energy sources subtotal 22.57%

Total 100%

Air Emissions

The amount of air pollution associated with the generation of the electricity product is shown. This amount is compared to a national benchmark. The benchmark approximates the average emission rate for all electricity generation in the U.S.

CO₂ is a "greenhouse gas," which may contribute to global climate change. SO₂ and NO_x released into the atmosphere react to form acid rain. NO_x also react to form ground level ozone, an unhealthy component of "smog."

Pounds Emitted per Megawatt Hour of Electricity Generated

Emission	Calpine Solutions' Product*
Sulfur Dioxide (SO ₂)	0.39
Nitrogen Oxide (NO _x)	0.32
Carbon Dioxide (CO ₂)	760.57

* Note: The emissions shown here are approximations based on the latest data available. Actual emissions may be lower.

See your Terms of Service for further information regarding this label. You may also call Calpine Energy Solutions, LLC for additional information or a copy of the Terms of Service at (877) 273-6772.
